A previous publication, PB-213 830, lists organic fractions of suspended particulate matter for 1968.

16. Abstracts

Particulate pollutant data gathered during 1969 and 1970 by the cooperating stations of the National Air Surveillance Networks provide the basis for listing the concentrations of the organic fraction of suspended particulate matter. The total amounts of benzene-soluble organic compounds and benzo(a)pyrene, a polynuclear aromatic hydrocarbon present in the benzene-soluble fraction, were measured in the laboratory using particulate samples collected at urban and nonurban sites. The data are presented in a quarterly composite format.

The APTD (Air Pollution Technical Data) series of reports is issued by the Office of Air Quality Planning and Standards, Office of Air and Water Programs, Environmental Protection Agency, to report technical data of interest to a limited number of readers. Copies of APTD reports are available free of charge to Federal employees, current contractors and grantees, and non-profit organizations - as supplies permit - from the Pollution Technical Information Center, Environmental Protection Agency, Research Triangle Park, North Carolina 27711 or may be obtained, for a nominal cost, from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22151.

Publication No. APTD-1465

PREFACE

The Quality Assurance and Environmental Monitoring Laboratory of the National Environmental Research Center-Research Triangle Park, with the assistance and cooperation of state and local agencies, conducts a variety of air sampling activities to obtain information about the air quality in the United States. Data from independent state and local sampling networks that have contributed their results to the National Aerometric Data Bank are available from the Monitoring and Data Analysis Division, Office of Air and Water Programs. The data reported are for benzene-soluble organics and benzo(a)pyrene, organic components of particulate matter.

Updated listings for this notebook will be provided as more current data are available. Any subsequent changes in the introductory material (site descriptions, data table presentations, laboratory methodology, etc.) made by EPA will be forwarded on a routine basis.

ACKNOWLEDGMENTS

The data reported in this publication could not have been gathered without the generous cooperation of the many state and local air pollution control agencies in the operation of the NASN stations. Gratitude is also due the agencies that have participated in this operation.

ABSTRACT

Particulate pollutant data gathered during 1969 and 1970 by the cooperating stations of the National Air Surveillance Networks provide the basis for listing the concentrations of the organic fraction of suspended particulate matter. The total amounts of benzene-soluble organic compounds and benzo(a)pyrene, a polynuclear aromatic hydrocarbon present in the benzene-soluble fraction, were measured in the laboratory using particulate samples collected at urban and nonurban sites.

The data are presented in a quarterly composite format. A previous EPA publication, APTD-0978, lists organic fractions of suspended particulate matter for 1968.

AIR QUALITY DATA FOR ORGANICS
1969 AND 1970

SECTION 1. INTRODUCTION

The Environmental Protection Agency (EPA), with the assistance and cooperation of state and local agencies, conducts a variety of air sampling activities to obtain information about the air quality in the United States. EPA generally provides the equipment, supplies, and laboratory analytical services; the cooperating agency provides the sampling site and the manpower. In addition to assisting in the operation of the EPA sampling network, many state and local air pollution control agencies operate their own air pollution control programs. Many such agencies contribute their data to EPA's aerometric data bank, and these data are included in other EPA publications. Data on the concentrations of benzene-soluble organic (BSO) fractions and benzo(a)pyrene (BaP) in suspended particulate matter collected at urban and nonurban sampling sites during 1969 and 1970 are included in this publication.

SAMPLING LOCATIONS

The monitoring sites are divided into two groups, urban sites located within a city or town or its suburban environs and nonurban sites located in rural or remote areas, in order to provide an indication of background levels of BSO and BaP. Within each section the data are arranged by year, then by urban and nonurban sites for that specific year.

Each monitoring site is assigned a unique code number. Details of site coding and a list of codes already assigned are found in the SAROAD Station Coding Manual.[1] Briefly, each twelve-digit site identification number is assigned as follows: the first two digits identify the state; the next four digits identify a city of at least 2500 persons, or a county (in some states, the corresponding jurisdiction is a parish, election district, or regional planning district); and the next three digits designate a specific address where the sampling equipment is operated. For example, 010380001 A01 refers to state 01 (Alabama), city 0380 (Birmingham), and site 001 (619 South 19th Street). The final three characters (A01) designate the agency project code. Some of the principal agency project codes are:

A01	EPA, population-oriented surveillance
A03	EPA, background surveillance
F01	State agency, population-oriented surveillance
G01	County agency, population-oriented surveillance
H01	City agency, population-oriented surveillance

A list of sampling site addresses is available in a separate publication.[2]

SAMPLING SCHEDULES

National Air Surveillance Networks (NASN) data originate from a bi-weekly (26 samples per year) modified random sampling schedule. The schedule is modified to ensure equal representation of each day of the week.

DESCRIPTION OF DATA TABLES

The basic format of data presentation is a quarterly composite table. For each site, a composite concentration value is reported for each of the four quarters of the calendar year and a yearly average is reported whenever valid data for all four quarters are obtained.

Data are judged to be representative and are included in the tables if there are at least five valid samples per quarter at each site. Furthermore, if no valid samples are reported in one month of a quarter, neither of the other two months in that quarter may have less than two valid samples if data for that quarter are to be reported. The yearly average presented in the tables is computed when at least three of a station's quarterly composite values exceed the minimum detectable concentration. When only one composite is below the minimum detectable, that value is replaced with one-half of the minimum detectable concentration and this value is used to compute the yearly average. When two or more composites are below the minimum detectable, the yearly average is not computed and the field is represented with an asterisk.

Table 1-1 lists the minimum detectable concentrations, urban and nonurban, for BSO fractions and BaP.

Table 1-1. URBAN AND NONURBAN DETECTABLE CONCENTRATIONS FOR ORGANICS

Organic	Detectable concentration	
	Urban	Nonurban
Benzene-soluble organic fractions	0.2 $\mu g/m^3$	0.10 $\mu g/m^3$
Benzo(a)pyrene	0.2 ng/m^3	0.08 ng/m^3

SECTION 2. LABORATORY METHODS

SUSPENDED PARTICULATE MATTER

The mass of particulate matter per volume of air is usually determined by drawing air through a pre-weighed glass filter with a high-volume (Hi-Vol) air sampler and then weighing the soiled filter. A calibrated rotameter is read at the start and finish of the sampling period, and the averaged value is used with a calibration table for that rotameter to obtain the flow rate. The known sampling period (24 hours) and the measured flow rate allow for calculation of the volume of air samples. The following procedure is used by EPA for all sampling conducted by NASN.

The Hi-Vol samplers, operating at approximately 1.5 cubic meters per minute, collect particulate matter from about 2200 cubic meters of air during the 24-hour sampling period. The filters used are 8- by 10-inch flash-fired glass-fiber filters selected for low and uniform background concentrations of those substances to be measured.

To eliminate any filters having pinholes or other flows that could affect air flow, the filters are screened for imperfections on a light table and then numbered. Prior to weighing, they are equilibrated for a minimum of 24 hours at a temperature of 24° Centigrade and a relative humidity of 50 percent or less. Because any crease in a filter can seriously affect the air flow, filters are weighed with a balance that permits weighing without bending.

The filters are then distributed unfolded to the cooperating local agencies. After sampling, the filters are folded in half with the collected particulate matter inside and returned to the laboratory. The filter with the collected particulates is again equilibrated for at least 24 hours at a temperature of 24° Centigrade and a relative humidity of 50 percent or less, and then weighed to determine the amount of particulate matter that was collected.

ORGANIC PARTICULATE MATTER

Benzene-soluble organics are determined by extraction of the samples with benzene in a Soxhlet extractor for 6 hours. This extraction process removes more than 90 percent of the benzene-soluble organic materials. After extraction, the solution is concentrated and then filtered into a tared vial. The remaining benzene is evaporated at 60° Centigrade and the residue is weighed.

The benzo(a)pyrene component of the benzene-soluble organic residue is determined after separating the different components by thin-layer chromatography and by removal of the BaP from the thin-layer absorbent. The BaP is then dissolved in sulfuric acid and its concentration is measured by fluorescence spectroscopy. BaP concentrations are expressed in nanograms per cubic meter.
